

Introduction to comments in Python

Types of syntax used for comment

```
In [1]: # : Is used to comment in one line
```

```
In [2]: # Triple Quotes (""" ) : Used for multiline comments
```

1. Commenting one line at a time

```
In [4]: # Performing addition of two variables
a = 12 # defining variable a and its value
b = 10 # defining variable b and its value
addition = a + b # Addition Logic definition
print(addition) # getting output
```

22

2. Commenting Multiple lines at a time

```
In [5]: """
These lines are commented to perform addition task
We will define two variables
we will apply addition logic
we will print the output
"""

a = 12
b = 10
addition = a + b
print(addition)
```

22

Commenting one line as well as multiple lines at the same time

```
In [6]: """
These lines are commented to perform addition task
We will define two variables
we will apply addition logic
we will print the output
"""

a = 12 # defining variable a and its value
b = 10 # defining variable b and its value
addition = a + b # Addition Logic definition
print(addition) # getting output
```
